## General Methods

All solvents and chemicals were used as received. Water was demineralized prior to use. Dry dichloromethane (DCM) and tetrahydrofuran (THF) were obtained from distillation over Merck molecular sieves ( $4 \AA$ ). Analytical thin layer chromatography (TLC) was carried out using Merck pre-coated silica gel plates (60F-254) using ultraviolet light irradiation at 254 or 365 nm. Manual column chromatography was carried out using Merck 60 Å pore size silica gel (particle size: 63-200 $\mu \mathrm{m}$ ). Flash chromatography was performed using Biotage SP1 equipped with Biotage SNAP FLASH purification silica cartridges (particles size: $50 \mu \mathrm{~m}$ ). General LC-MS analysis: samples were analyzed using a Shimadzu SCL-10 AD VP series HPLC coupled to a diode array detector (Finnigan Surveyor PDA Plus detector, Thermo Electron Corporation) and an Ion-Trap (LCQ Fleet, Thermo Scientific). Analyses were performed using a reversed phase HPLC column (GraceSmart PP18, $50 \mathrm{~mm} \times 2.1 \mathrm{~mm}, 3 \mu \mathrm{~m}$ ), using an injection volume of $1-4 \mu \mathrm{~L}$, a flow rate of $0.20 \mathrm{~mL} / \mathrm{min}$ and a typically a gradient (5\% to $100 \%$ in 10 min , held at $100 \%$ for 1 more minute) of acetonitrile in water (both containing $0.1 \%$ formic acid) at 298 K . Reversed phase high-pressure liquid chromatography (RP-HPLC) was performed on a Shimadzu LC-8A HPLC system by using a Gemini 5u C18 column. A gradient of water in acetonitrile, both containing $0.1 \%$ formic acid was used to elute products. Detection was performed by a Shimadzu SPD-10AV UV-detector ( $\lambda=240 \mathrm{~nm}$ ). Preparative recycling GPC was performed using a Shimadzu system equipped with a Shimadzu LC-10ADvp pump, a Jai-Gel 2.5 H and a Jai-Gel 2 H column in series and a Shimadzu SPD-10AVvp UV/Vis detection system performing detection at 254 nm and 340 nm . HPLC grade chloroform was used as the eluent (with a flow of $3.5 \mathrm{ml} / \mathrm{min}$ and manual injection was performed with a volume of 2 ml . One cycle through the system took 1 hour.) Matrix assisted laser desorption/ionization time of flight mass spectra (MALDI-TOFMS) were measured on a PerSeptive Biosystems Voyager-DE PRO spectrometer with a Biospectrometry workstation using 2-[(2E)-3-(4-tert-butylphenyl)-2-methylprop-2-enylidene] malononitrile (DCTB) as matrix material. $\mathrm{M} / \mathrm{z}$ values are given in gram/mol. ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR spectra were recorded using a Varian Mercury Vx 400 MHz ( 100 MHz for 13C) NMR spectrometer at 298 K . Chemical shifts are given in parts per million (ppm) and the spectra are calibrated to residual solvent signals of $\mathrm{CDCl}_{3}\left(7.26 \mathrm{ppm}\left({ }^{1} \mathrm{H}\right)\right.$ and $77.0 \mathrm{ppm}\left({ }^{13} \mathrm{C}\right)$ ). Splitting patterns are labeled as s, singlet; d, doublet; dd, double doublet; t, triplet; m, multiplet and br stands for broad. Fluorescence spectra for the energy transfer studies of nanoparticles self-assembled of two chromophores were recorded on a Varian Cary Eclipse
fluorescence spectrophotometer equipped with a Perkin-Elmer PTP-1 Peltier temperature control system.

The synthesis of 2a, ${ }^{\text {S1 }} \mathbf{3 a}, \mathbf{4 a}, \mathbf{5 a},{ }^{\mathrm{S} 2} \mathbf{8 a}$, Apolar-N, Apolar-B, ${ }^{\mathrm{S} 3}$ Bola-N and Bola-B ${ }^{\text {S4 }}$ have already been described elsewhere.

General procedure for the synthesis of boronic ester (5b, 13, 14):

Bromofluorene derivatives were mixed to bis(pinacolato)diboron (1.5 eq.), KOAc (4 eq.), $\mathrm{Pd}(\mathrm{dppf}) \mathrm{Cl}_{2}$ (cat.) in dioxane ( 10 ml ) and refluxed overnight. The reaction was further poured into cold water ( 100 ml ), and taken up in $\mathrm{CHCl}_{3}(40 \mathrm{ml})$ and extracted several time. The organic extracts were dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$, condensed, and purified by column chromatography.

Aryl dibromide $\mathbf{B r}-\mathbf{N}-\mathbf{B r}$ or $\mathbf{B r}-\mathbf{B}-\mathbf{B r}$, aminofluorene boronic ester, $\mathrm{Na}_{2} \mathrm{CO}_{3}$ were charged in a two necked flask under an atmosphere of $\operatorname{Argon} . \mathrm{Pd}\left(\mathrm{PPh}_{3}\right)_{4}$ and subsequently a degassed mixture of dioxane and water (2:1) were added. The reaction mixture wad refluxed overnight, then poured into water and extracted with $\mathrm{CHCl}_{3}$ several times. The organic extracts were washed with brine, dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$, and condensed. Pure compounds were obtained after column chromatography.

General procedure for reactions with acid chloride derivatives (12, 14, Amp1-N, Amp1-B, Amp3-N, Amp3-B, Amp2-N, Amp2-B)

Acid chloride derivatives $\mathbf{1 0}$ and $\mathbf{1 1}$ were prepared in situ according to a literature procedure from its corresponding acid and oxalyl chloride. ${ }^{\text {S5 }}$ Aromatic amine derivatives and triethyl amine were dissolved in dry chloroform, and the acid chloride was added as a solution in dry chloroform. After stirring at room temperature overnight, the mixture was evaporated, and the product directly purified by column chromatography.

The reaction was then cool down at room temperature and taken back in ethyl acetate. The organic extracts was successively washed with diluted HCl solution and brine (3 times), dried over MgSO4, and condensed. Column chromatography (SNAP 25, AcOEt 0\% to 80\% in heptane) gave 2b ( $5.998 \mathrm{~g}, 13 \mathrm{mmol}, 93 \%$ ) as a yellow oil. ${ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 7.62-7.67$ $(\mathrm{m}, 1 \mathrm{H}), 7.56\left(\mathrm{~d},{ }^{4} \mathrm{~J}=1.6 \mathrm{~Hz}, 1 \mathrm{H}\right), 7.53\left(\mathrm{~d},{ }^{3} \mathrm{~J}=8.0 \mathrm{~Hz},{ }^{1} \mathrm{H}\right), 7.46\left(\mathrm{dd},{ }^{3} \mathrm{~J}=8.0 \mathrm{~Hz},{ }^{4} \mathrm{~J}=1.6 \mathrm{~Hz}\right.$, $1 \mathrm{H}), 7.37-7.42(\mathrm{~m}, 1 \mathrm{H}), 7.30-7.36(\mathrm{~m}, 2 \mathrm{H}), 3.28-3.31(\mathrm{~m}, 10 \mathrm{H}), 3.14-3.22(\mathrm{~m}, 4 \mathrm{H}), 2.70-2.79$ (m, 4H), 2.33-2.43 (m, 4H) ; ${ }^{13} \mathrm{C}$ NMR ( $100 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 151.12,148.52,139.44,139.40$, 130.41, 127.80, 127.47, 126.65, 123.20, 121.20, 121.09, 119.87, 71.72, 69.91, 66.90, 58.99, 51.47, 39.57; MALDI-TOF MS: calc. ## Formation and Characterization of the Self-Assembled Nanoparticles in Water

Preparation of nanoparticles: Injection of $15 \mu \mathrm{~L}$ of 1 mM THF stock solution into 5 mL of water results in a $3 \mu \mathrm{M}$ nanoparticle solution. Annealing was performed by heating the sample to $90^{\circ} \mathrm{C}$ and cooling down to $20^{\circ} \mathrm{C}$.

Table S1. Optical characteristics of all compounds in THF ( $3 \mu \mathrm{M}$ ) and of the nanoparticles in water (before and after annealing, $3 \mu \mathrm{M}$ ). Solutions were measured in a liquid cell with a 1 cm path length for UV-vis and 1 mm path length for Fluorescence at room temperature.

Table S2. The DLS data were fitted to a first or second order exponential decay to fit all data (mono- and bimodal samples) for best comparison. From the extracted decay rates $\Gamma$ the diffusion constant was determined and hydrodynamic radii obtained by making use of the Stokes-Einstein relation. The experimental error in the hydrodynamic radius is $1 \%$.

## Critical Aggregation Concentration

The critical aggregation concentration (CAC) of the particles was determined by a previous reported method ${ }^{[54]}$ using nanoparticles containing both a naphthalene derivative, as an energy donor and benzothiadiazole, as an energy acceptor in a ratio of $95: 5$. Upon dilution, the energy transfer efficiency was measured. At a certain point an increase of the blue donor emission relative to the yellow acceptor emission was observed, revealing that the nanoparticles started to disassemble, reflecting the CAC.

Table S3. Summary of the critical aggregation concentration (CAC) for the nanoparticles.

|  | CAC |
| :---: | :---: |
| $95 / 5$ | $\mathrm{M}^{-1}$ |
| Apolar-N/Apolar-B | $10^{-10}$ |
| Amp1-N/Amp1-B | $10^{-9}$ |
| Amp2-N/Amp2-N | $10^{-9}$ |
| Amp3-N/Amp3-N | $10^{-8}$ |
| Bola1-N/Bola1-B | $10^{-9}$ |
| Bola2-N/Bola2-B | $10^{-7}$ |

Figure S19. a) The two component nanoparticles (Amp1-B/Amp1-N; Amp1-B/Amp2-N and Amp1-B/Amp3-N) were self-assembled of two chromophores with distinct pendant side chains and annealed (excitation wavelength $\lambda e x c=340 \mathrm{~nm}$ ). The intensity (normalized) of donor emission as a function of acceptor percentage decreased non-linearly revealing energy transfer.
